 Pego, Alicante, Spain

Summary

Senior Frontend Engineer with 6+ years of commercial experience building production web applications with React, TypeScript, and Next.js. Specialized in AI-powered SaaS products, real-time data interfaces (GraphQL/Apollo Client), and scalable design systems.

Recent focus: frontend for AI products — built the core web application for an AI-powered digital clone platform (CloneForce), integrating voice AI (ElevenLabs), real-time GraphQL subscriptions, and OAuth flows for third-party services.

Deep Apollo Client expertise: custom cache strategies, type policies, AC3→4 migration, WebSocket subscriptions. Strong background in design systems (4 projects: Yara International, HCX, Bridge The Gap, CloneForce), performance optimization (40% load time reductions), testing culture (Jest, Cypress, Playwright), and CI/CD integration.

Experience across startup, scale-up, and enterprise environments with fully distributed international teams.

Based in Pego, Spain. Available for remote roles across Europe (CET/CEST timezone).

Technical Skills: React, TypeScript, JavaScript ES6+, Next.js (SSR/SSG), Apollo Client/GraphQL, REST APIs, Redux, Jotai, MUI, Tailwind, SASS, Webpack, Jest, Cypress, Playwright, Storybook, Git, CI/CD

Experience:

CloneForce, Newport Beach, California, United States (Remote)

November 2024–March 2026

Frontend Engineer - Contractor

Joined CloneForce <https://cloneforce.com/> as a Frontend Engineer on an AI-powered digital clone platform — a product that creates personalized AI assistants and coaches powered by OpenAI, Pinecone (RAG), and ElevenLabs, deployed across Slack, MS Teams, and web channels. Led frontend development of a dynamic web application, building interfaces for real-time human-AI interactions and automation.

- Led frontend architecture of the core web app using Next.js, TypeScript, Apollo Client, Jotai, and MUI — designing dynamic interfaces for intelligent clone interactions.
- Architected a component library of 50+ reusable UI components with MUI theming from scratch, ensuring visual consistency across the platform.
- Integrated ElevenLabs voice chat via React SDK — replaced the default embed widget with a custom implementation for full control over the conversational voice UI.
- Implemented real-time data updates through GraphQL subscriptions (graphql-ws), enabling live clone interactions and streaming AI responses.
- Built OAuth integration flows for Microsoft, Google, and HubSpot, enabling clone skills to connect with external platforms on behalf of users.
- Configured AI-assisted development infrastructure: strict TypeScript, ESLint, GitHub branch protections, and detailed architecture docs — ensuring AI-generated code follows the same patterns as human-written code.
- Reduced page load time by 40% through code splitting, lazy loading, and Apollo Client cache optimization.
- Implemented comprehensive E2E testing with Cypress, covering critical user flows across the AI assistant interface.

Technologies Used: React, Next.js (SSR), TypeScript, Jotai, Tailwind, SASS, MUI, Apollo GraphQL, GraphQL Subscriptions, ElevenLabs React SDK, Webpack, Jest, Cypress, Git

On the Beach, Manchester, England, United Kingdom (Remote)

April 2025–Oct 2025

FullStack Engineer - Contractor

FullStack Engineer in a UK-based team to modernize and support the On the Beach holiday platform: <https://www.onthebeach.co.uk/>. The role involves working with a large legacy codebase, focusing on refactoring, component modernization, and improving maintainability, performance, and developer experience.

I collaborate with UK colleagues to deliver new features and experiments using JavaScript, TypeScript, GraphQL, React 19, and Next.js 15, employing feature flags for controlled rollouts and quick reversions. My work spans frontend optimization, API integrations, and user experience enhancements, contributing flexibly across multiple areas of the platform.

As part of the Shop XP team, I've led and contributed to several key initiatives, including:

- Upgrading the Booking Flow technology stack to the latest React 19 and Next.js 15, improving performance, security, and engineering efficiency.
- Migrating from Apollo Client 3 to Apollo Client 4, enhancing data management, caching performance, and overall stability.
- Implementing new UI toggle features, refining default search logic, and expanding tracking coverage for analytics and experimentation.
- Implemented feature flags for controlled rollouts and A/B experimentation, enabling data-driven UI decisions across 3 concurrent experiments.

These improvements have resulted in faster page loads, smoother navigation between search and deal detail pages, and a more reliable, scalable foundation for future development.

Technologies Used: JavaScript ES6+, TypeScript, React 19, Next.js 15 (SSR/SSG), MobX, Apollo Client 4, GraphQL, Webpack, Git

Human Capital Exchange, Los Angeles - (Remote)

Sep 2022 - Nov 2024

Frontend Engineer - Contractor

Developed an [HCX](#) trading platform for a new equity-based asset class using React, Typescript, GraphQL, Jotai, and Jest.

- Configured CI/CD pipeline with Jest unit tests and Cypress E2E integration, achieving 80%+ test coverage on critical user flows and reducing regression bugs by 35%.
- Streamlined account setup with multi-form flows for different users, integrating JSON Forms, Yup validation, and Apollo GraphQL, improving form submission efficiency by 90%.
- Updated API in partnership with the backend team, adding features and fixing bugs, which boosted server performance by 20% and accelerated feature deployment by 25%.
- Streamlined the system by removing 3 blockchain libraries, shifting to bank transactions, and introducing debit/credit card and bank account features, reducing operation costs by 30%.
- Orchestrated the integration of DocuSign for in-app application signings, streamlining the process and reducing turnaround time by 40%, ensuring compliance with stringent KYC regulations and legal requirements.
- Led the integration process for newly hired developers, reducing onboarding time from one month to 1 week.
- Built CI/CD testing pipeline integrating Jest (unit) and Cypress (E2E) for automated user flow validation, reducing manual QA time by 25% and catching regressions before deployment
- Enhanced Material-UI global theme, streamlining common styles to save 68 workdays on component creation and keeping the company 8000\$.

Technologies Used: React.js, Typescript, Jotai, Material-UI, Figma, Apollo GraphQL, React Native, DnD kit, TV Chart Library, Nx Monorepo, Next.js, WordPress, Jest, Cypress.

Yara International, Singapore - (Remote)

Aug 2023 - Jan 2024

UI Engineer

Hired to the design system's team of 10 developers to enhance the usability and accessibility of [Yara International's](#) design system.

- Added over 10 new components to the design system, fully refactoring existing ones, improving accessibility to meet global standards, and boosting compliance by 44%.
- Created a novel token system, enhancing design-to-code efficiency by 32%, leading to smoother design adoption and uniformity across projects.
- Developed closely with designers to refine and implement component designs, discussing the overall look of the Storybook theme.

Technologies Used: React.js, TypeScript, Storybook, Figma, Design Systems, Radix UI, GitHub, React Native, Accessibility (WCAG), Design Tokens

I was recruited to join a team of developers led by Varia Stepanova and to contribute to npm Design System. This role enabled me to combine my technical expertise with a keen sense of design.

- Maintained Next.js website, migrating from Next.js 12 to 14
- Update design-system npm library with new React components.
- Successfully migrated the web application from Gatsby@3 to Gatsby@5
- Refactoring of project components, and enhancing performance and maintainability. This included upgrading dependencies such as @mdx-js/react, refining code quality with ESLint and Prettier, and improving UI components and image displays on web pages.
- Contributed to the evolution of the npm library of the Design System, implementing significant updates to the ProfileCard component across multiple releases, enhancing layout styling, and updating key attributes to boost user interface consistency and functionality.

Technologies Used: React.js, Next.js, Gatsby, TypeScript, Design Systems, npm, ESLint, Prettier, MDX, Git

Maintained the innovative digital identity platform [RNS](#) to issue digital IDs for Palau's digital residence, and led the international tech team in creating applications from scratch.

- Spearheaded the creation of 3 landing pages, 2 web apps, and 35 email HTML templates for user subscriptions, enhancing user engagement, and integrating new features such as ID verification, TypeScript migration, and Jest test coverage.
- Refined MaterialUI components to styled components, enhancing UI flexibility and responsiveness; decreased app load time by 40% and elevated user experience satisfaction ratings by 15%.
- Managed complex application state with Redux and Redux Toolkit; later led migration to MobX, reducing boilerplate by 40% and improving maintainability — demonstrating deep understanding of multiple state management approaches.
- Integrated internationalization using i18n, expanding market reach by enabling content localization for 12 new languages, which led to a 28% increase in global user engagement.

Technologies Used: React.js, Next.js, TypeScript, JavaScript ES6+, Tailwind, SASS, Redux, Redux Toolkit, MobX, Material-UI, Styled Components, i18n, Jest, Webpack, S3, Git

- Developed responsive HTML/CSS templates and landing pages for e-commerce clients, improving mobile conversions by 30%.
